let food be thy medicine

For Individuals Seeking medical insurance Coverage

"Let food be thy medicine and medicine be thy food."

~ Hippocrates

An unfortunate reality in today's current insurance model is that interventions e.g. whole food nutritional support are often not covered while many much more expensive tests and treatments are covered despite their expense and lack of efficacy. Understanding that challenge, here are some very important clinical considerations that can be considered by your treating physician and your insurance company that may put Liquid Hope or Nourish into a different risk-benefit cost analysis.

Compared to the many traditional enteral nutritional support options that exist, NONE address the complete nutritional and physiological needs in a manner that is as nutrient dense and as non-toxic (compared with sugar, corn syrup, high-glycemic, GMO-based products) as Liquid Hope or Nourish.

Experience based on hundreds of children and adults substituting current market brands of enteral formulas with Liquid Hope and Nourish include:

- Lower glycemic effect i.e. less elevation of sugar and insulin known to be a major risk for infection, altered wound healing, and systemic inflammation.
- Improved gastrointestinal function with improved digestion and nutrient absorption; less nausea, gas, and bloating; more desirable nutrient-fiber density to promote healthier flora balance or "microbiome" balance. This is now a major area of scientific research as "gut flora balance" appears to have a major influence on immune function, cognition, metabolic efficiency, energy production, and overall health.
- Significant reductions in inflammation e.g. reduced respiratory mucous production, gastrointestinal sensitivity, reduced pain, reduced infectious complications, improved mood, cognition, etc..
- Liquid Hope and Nourish have the potential to do so much more than "feed" the individual. It has the potential to transform the biology of the individual in a way that impacts life in a meaningful and measurable way.

While research in this critical area is rapidly evolving and clinical data for individuals supported by Liquid Hope or Nourish is planned for future clinical trials, the scientific evidence is increasingly clear that nutrient dense whole foods have the capacity to alter DNA (a science known as epigenetics) in a way that can fundamentally transform gene expression, cell and tissue function, and ultimately broader dimensions of health for the "whole" human. Holistic approaches to healing and in this case nutritional support have the potential to revolutionize care by addressing "root causes" of illness and diminished quality of life.
